OXADIAZOLE, THIADIAZOLE AND TRIAZOLE DERIVATIVES  
AND COMBINATORIAL LIBRARIES THEREOF

## BACKGROUND OF THE INVENTION

## FIELD OF THE INVENTION

5           The present invention relates generally to the synthesis of compounds comprising heterocyclic rings. In one specific embodiment, the invention provides novel oxadiazoles as well as novel combinatorial libraries comprised of such compounds.

10 BACKGROUND INFORMATION

The process of discovering new therapeutically active compounds for a given indication involves the screening of all compounds from available compound collections. From the compounds tested one or more structure(s) is selected as a promising lead. A large number of related analogs are then synthesized in order to develop a structure-activity relationship and select one or more optimal compounds. With traditional "one-at-a-time" synthesis and biological testing of analogs, this optimization process is long and labor intensive. Adding significant numbers of new structures to the compound collections used in the initial screening step of the discovery and optimization process cannot be accomplished with traditional "one-at-a-time" synthesis methods, except over a time frame of years or even decades. Faster methods are needed that allow for the preparation of up to thousands of related compounds in a matter of days or a few weeks. This need is particularly evident when it comes to synthesizing more complex compounds, such as oxadiazoles.

Solid-phase techniques for the synthesis of peptides have been extensively developed and combinatorial libraries of peptides have been generated with great success. During the past four years there has  
5 been substantial development of chemically synthesized combinatorial libraries (SCLs) made up of peptides. The preparation and use of synthetic peptide combinatorial libraries has been described, for example, by Houghten et al., (*Proc. Natl. Acad. Sci. USA* 1985, 82, 5131;  
10 *Biochemistry*, 1993, 32, 11035; and U.S. Patent No. 4,631,211) utilized individual polyethylene bags, referred to "tea bags" to generate peptide libraries. The tea bags, containing C-terminal amino acids bound to a solid support, were mixed and coupled with the  
15 requisite amino acids using solid phase synthesis techniques. Common steps, such as resin washing and deprotection of  $\alpha$ -amino groups, can be performed simultaneously in a single reaction vessel and upon completion of the synthesis, each bag contained a single  
20 peptide sequence. Dooley et al. in U.S. Patent 5,367,053, used combinatorial libraries for the determination of high affinity opioid receptors. Huebner in U.S. Patent 5,182,366, describes a method of preparing a mixture of peptides having known composition using  
25 three essential steps, dividing an amount of a mixture of amino acid derivatized resins, coupling a subsequent amino acid and combining a known amount of a different resin together to obtain peptide mixtures. Also described are methods to retrieve and analyze the amino  
30 acid sequence. Appel et al. in WO PCT 92/09300, describes the synthesis of complex mixtures of solid support-coupled amino acids in which the mixture contains an equimolar representation of each reacted amino acid coupled. Geysen in published European Patent Application  
35 0 138 855 describes a method of synthesizing a peptide library and detecting a peptide comprising a sequence of

amino acids which has antigenic activity. Pirrung et al. in U.S. Patent 5,143,854 describe polypeptide arrays synthesized using photoremovable groups. Synthesized combinatorial libraries have provided an extraordinary number of various peptides in such libraries and the availability of rapid screening of the library which can identify lead pharmaceutical peptides.

Combinatorial approaches have recently been extended to "organic," or non-peptide, libraries. 10 Zambias et al. (U.S. Patent No. 5,712,171) describe a method of generating libraries that contain aminimides, oxazolones, sulfonylaminides and phosphonylaminides as the core structure in spatially arranged arrays. Combinatorial chemical methods have been applied to a 15 limited number of heterocyclic compounds, as described, for example, in U.S. Patent Nos. 5,288,514; 5,324,483; and Goff et al., *J. Org. Chem.*, 60:5748-5749 (1995). See also U.S. Patent Nos. 5,549,974 and 5,506,337. However, the heterocyclic libraries to date contain compounds of 20 limited diversity and complexity.

Substituent limitations have been overcome for mixtures of peptides and peptidomimetics through the use of solid phase techniques versus solution-phase. An important step in the development of solid-phase 25 techniques was the discovery of methods to prepare large numbers of individual compounds simultaneously, as described, for example, by Houghten in U.S. Patent No. 4,631,211. These solid phase methods, however, have rarely been applied to the syntheses of complex 30 heterocyclic structures. Therefore a need exists to develop more complex "organic" libraries based on heterocyclic medicinal compounds which would need less time and effort in the synthesis and testing required to bring an organic pharmaceutical product to fruition. In 35 short, improved methods for generating therapeutically

useful heterocyclic compounds, such as oxadiazole and thiadiazole derivatives, are desired.

Oxadiazoles, for example, have been the subject of investigation in a number of different biological areas. A number of patents cite oxadiazole derivatives as pesticides and acaricides. 1,2,4-Oxadiazoles have been proposed as: (a) muscarinic receptor agonists (as described by Messer W. S. Jr., et al., *J. Med. Chem.* 40:1230 (1997); Showell, G. A., et al., *J. Med. Chem.*, 34:1086 (1991); Orlek, B. S., et al., *J. Med. Chem.*, 34:2726 (1991)), (b) benzodiazepine receptor agonists (as described by Watjen, F., et al. *J. Med. Chem.*, 32:2282 (1989)), (c) histamine H<sub>3</sub> receptor antagonists (as described by Clitherow, J. W.; et al. *Bioorg. Med. Chem. Lett.*, 6: 833 (1996)), and (d) antiviral compounds (as described by Diana, G. D., et al. *J. Med. Chem.*, 37:2421 (1994)). In general, the oxadiazole ring system has been used as a replacement for ester or amide functionalities and has been primarily limited to simpler alkyl and aryl derivatives (Andersen, K. E., et al. *Eur. J. Med. Chem.*, 31:417 (1996)). A series of dipeptidomimetic oxadiazoles have been made and incorporated into peptide sequences as replacements for dipeptides (Borg, S., et al., *Proc. Am. Pept. Symp.*, 14th, 689-690, (Mayflower Scientific, Kingswinford, UK 1996); Borg, S., et al. *J. Org. Chem.*, 60:3112 (1996); Borg, S., et al. *Eur. J. Med. Chem.* 28:801 (1993)). Oxadiazoles with a 5-chloromethyl substituent have been described as plant growth regulators (Jpn. Kokai Tokkyo Koho, 4 pp. CODEN: JKXXAF, JP 57188503 A2 821119; Showa, Application Ser. No.: JP 81-74643 810518). Other chloromethyl oxadiazoles have been made and used to alkylate amines and other nucleophiles (Croveti, A. J., et al., *J. Heterocycl.*

*Chem.*, 9:435 (1972)). However, a systematic exploration of oxadiazoles has not been performed.

The general methods for the synthesis of 1,2,4-oxadiazoles fall into two categories: acylation and  
5 cyclization of amidoximes, or dipolar cycloaddition of nitrile oxides to nitriles (Lianis, P.S., et al., *J. Heterocyclic Chem.*, 26:1683 (1989)). The latter is possible only with highly activated nitriles and thus has limited utility. The most general method of synthesis  
10 relies on the acylation and cyclization of amidoximes. Amidoximes are prepared from aliphatic or aromatic nitriles by addition of hydroxylamine. Conversion to the oxadiazoles is realized by treatment with acid chlorides (Chiou, S., et al., *Chem. Ber.* 17:1685 (1984)) or  
15 anhydrides in refluxing pyridine (Claisse, J. A., et al. *J. Chem. Soc. Perkin I*, 2241 (1973)). Liang and Feng used the symmetrical anhydrides generated from 2-hydroxy carboxylic acids in the presence of a carbodiimide as the acylating species to give 5-hydroxymethyl substituted  
20 oxadiazoles (Liang, G. B., et al. *Tetrahedron Lett.*, 37: 6627 (1996)). However, in the majority of examples, only simple aliphatic or aromatic carboxylic acid derivatives have been used.

This invention satisfies these needs and  
25 provides related advantages as well. The present invention overcomes the known limitations to classical organic synthesis of oxadiazoles, for example, as well as the shortcomings of combinatorial chemistry related to heterocycles. The present invention allows for rapid  
30 generation of large diverse libraries of complex heterocycles as discrete molecules or molecules bound to a resin. The present invention can utilize a readily available pool of building blocks that can be incorporated into the various regions of the molecule.

Furthermore, the method of making the present invention allows for the use of building blocks that contain a wide range of diverse functionality. Therefore, building blocks, such as those described above, can provide  
5 libraries that consist of large numbers as well as libraries that are extremely diverse with respect to the functionality contained within those libraries. The present invention combines the techniques of solid-phase  
10 synthesis of heterocycles and the general techniques of synthesis of combinatorial libraries to prepare highly diverse new oxadiazole, thiadiazole and triazole compounds.

The present invention also provides a method of preparing libraries wherein compounds of Formula (I), in particular, oxadiazoles, are made by reacting a resin-bound amine with a nitrile-containing carboxylic acid, nitrile-containing isocyanate or nitrile-containing radical with a leaving group to obtain a resin-bound nitrile; cyclizing the nitrile to obtain an oxadiazole containing an amino-protected group; deprotecting the amino-protected group to obtain an oxadiazole amine; and reacting the oxadiazole amine with a carboxylic acid or a sulfonyl chloride or an isocyanate or an isothiocyanate to obtain the oxadiazole library. Another method of preparing oxadiazole libraries comprises reacting a resin-bound amine with a nitrile-containing carboxylic acid, isocyanate or leaving group to obtain a resin-bound nitrile; cyclizing the nitrile to obtain an oxadiazole containing a leaving group; and reacting the leaving group with a primary amine or secondary amine to obtain a oxadiazole secondary amine or oxadiazole tertiary amine; and optionally reacting the secondary amine with a carboxylic acid or a sulfonyl chloride or an isocyanate or an isothiocyanate to obtain the oxadiazole library. In a preferred embodiment the resin-bound amine can be prepared by displacing a resin-bound leaving group with a primary amine. In another embodiment, the resin-bound amine can be prepared by reducing a resin-bound imine formed from either a resin-bound aldehyde with a primary amine or a resin-bound primary amine with an aldehyde.

Yet another method comprises reacting a resin-bound leaving group with a nitrile-containing phenoxide ion or amine to obtain a resin-bound nitrile; cyclizing the nitrile to obtain to an oxadiazole containing an amino-protected group; deprotecting the amino-protected group to obtain an amine; and reacting the amine with a carboxylic acid or a sulfonyl chloride or an isocyanate or an isothiocyanate to obtain the oxadiazole library. Still another method comprises reacting a resin-bound leaving group with a nitrile-containing phenoxide ion to obtain a resin-bound nitrile; cyclizing the nitrile to obtain an oxadiazole containing a leaving group; and reacting the leaving group with a primary or secondary amine to obtain a secondary or a tertiary amine of the oxadiazole library; and optionally reacting the secondary amine with a carboxylic acid or a sulfonyl chloride or an isocyanate or an isothiocyanate to obtain the oxadiazole library.

Alternatively, the present invention also provides a method of preparing oxadiazole libraries wherein oxadiazole compounds of Formula (I) are made by reducing an imine formed between a resin-bound aldehyde and an amine containing a protected carboxylic acid to give a protected carboxylic acid bound to resin; deprotecting the protected carboxylic acid to give a resin bound carboxylic acid and reacting the carboxylic acid with an amidoxime to give an oxadiazole library.

Another method of preparing oxadiazole libraries comprises reacting a resin-bound alcohol with an amine containing a protected carboxylic acid to give a protected carboxylic acid bound to resin through a carbamate linkage; deprotecting the protected carboxylic acid to give a carboxylic acid and reacting the carboxylic acid with an amidoxime to give an oxadiazole library.

In a preferred embodiment, the methods described above further comprise the step of cleaving the library from the resin.

One or more compounds of the invention, even when in a library, can be in the biologically active ester form, such as the non-toxic, metabolically-labile ester-form. Such ester forms induce increased blood levels and prolong the efficacy of the corresponding non-esterified forms of the compounds. Ester groups which can be used include the lower alkoxymethyl groups, for example, methoxymethyl, ethoxymethyl, isopropoxymethyl and the like; the  $-(C_1 \text{ to } C_7)$  alkoxyethyl groups, for example methoxyethyl, ethoxyethyl, propoxyethyl, isopropoxyethyl and the like; the 2-oxo-1,3-dioxolen-4-ylmethyl groups, such as 5-methyl-2-oxo-1,3-dioxolen-4-ylmethyl, 5-phenyl-2-oxo-1,3-dioxolen-4-ylmethyl and the like; the  $C_1$  to  $C_4$  alkylthiomethyl groups, for example methylthiomethyl, ethylthiomethyl, iso-propylthiomethyl and the like; the acyloxymethyl groups, for example pivaloyloxymethyl, pivaloyloxyethyl, -acetoxymethyl and the like; the ethoxycarbonyl-1-methyl group; the -acetoxyethyl; the 1- $(C_1 \text{ to } C_7 \text{ alkylloxycarbonyloxy})$ ethyl groups such as the 1-(ethoxycarbonyloxy)ethyl group; and the 1- $(C_1 \text{ to } C_7 \text{ alkylaminocarbonyloxy})$ ethyl groups such as the 1-(methylaminocarbonyloxy)ethyl group.

The term "amino acid" includes any one of the twenty naturally-occurring amino acids or the D-form of any one of the naturally-occurring amino acids. In addition, the term "amino acid" also includes other non-naturally occurring amino acids besides the D-amino acids, which are functional equivalents of the naturally-occurring amino acids. Such non-naturally-occurring amino acids include, for example, norleucine ("Nle"), norvaline ("Nva"), L- or D- naphthalanine, ornithine ("Orn"), homoarginine (homoArg) and others well known in the peptide art, such as those described in M. Bodanzsky,

"Principles of Peptide Synthesis," 1st and 2nd revised ed., Springer-Verlag, New York, NY, 1984 and 1993, and Stewart and Young, "Solid Phase Peptide Synthesis," 2nd ed., Pierce Chemical Co., Rockford, IL, 1984, both of which are incorporated herein by reference. Amino acids and amino acid analogs can be purchased commercially (Sigma Chemical Co.; Advanced Chemtech) or synthesized using methods known in the art.

The term "functionalized resin" means any resin, crosslinked or otherwise, where functional groups have been introduced into the resin, as is common in the art. Such resins include, for example, those functionalized with amino, alkylhalo, formyl or hydroxy groups. Such resins which can serve as solid supports are well known in the art and include, for example, 4-methylbenzhydrylamine-copoly(styrene-1% divinylbenzene) (MBHA), 4-hydroxymethylphenoxyethyl-copoly(styrene-1% divinylbenzene), 4-oxymethyl-phenyl-acetamido-copoly(styrene-1% divinylbenzene) (Wang), 4-(oxymethyl)-phenylacetamido methyl (Pam), and Tentagel™, from Rapp Polymere GmbH, trialkoxy-diphenyl-methyl ester-copoly(styrene-1% divinylbenzene) (RINK) all of which are commercially available. Other functionalized resins are known in the art and can be used without departure from the scope of the current invention. Such resins may include those described in Jung, G., Combinatorial Peptide and Nonpeptide Libraries, A Handbook (VCH Verlag, 1996) or Bunin, B. A., The Combinatorial Index (Academic Press, 1998) and are incorporated herein by reference.

As used herein, a "combinatorial library" is an intentionally created collection of differing molecules which can be prepared by the means provided below or otherwise and screened for biological activity in a variety of formats (e.g., libraries of soluble molecules, libraries of compounds attached to resin beads, silica

chips or other solid supports). A "combinatorial library," as defined above, involves successive rounds of chemical syntheses based on a common starting structure. The combinatorial libraries can be screened in any  
5 variety of assays, such as those detailed below as well as others useful for assessing their biological activity. The combinatorial libraries will generally have at least one active compound and are generally prepared such that the compounds are in equimolar quantities.

10 Compounds disclosed in previous work that are not in a mixture are not part of a "combinatorial library" of the invention. In addition, compounds that are in an unintentional or undesired mixture are not part of a "combinatorial library" of the invention.

15 A combinatorial library of the invention can contain two or more of the above-described compounds. The invention further provides a combinatorial library containing five or more of the above-described compounds. In another embodiment of the invention, a combinatorial  
20 library can contain ten or more of the above-described compounds. In yet another embodiment of the invention, a combinatorial library can contain fifty or more of the above-described compounds. If desired, a combinatorial library of the invention can contain 100,000 or more, or  
25 even 1,000,000 or more, of the above-described compounds.

By way of example, the preparation of the combinatorial libraries can use the "split resin approach." The split resin approach is described by, for example, U.S. Patent 5,010,175 to Rutter, WO PCT 91/19735  
30 to Simon, and Gallop et al., *J. Med. Chem.*, 37:1233-1251 (1994), all of which are incorporated herein by reference.

The amino acids are indicated herein by either their full name or by the commonly known three letter code. Further, in the naming of amino acids, "D-" designates an amino acid having the "D" configuration, as opposed to the naturally occurring L-amino acids. Where no specific configuration is indicated, one skilled in the art would understand the amino acid to be an L-amino acid. The amino acids can, however, also be in racemic mixtures of the D- and L-configuration or the D-amino acid can readily be substituted for that in the L-configuration.

For preparing pharmaceutical compositions containing compounds of the invention, inert, pharmaceutically acceptable carriers are used. The pharmaceutical carrier can be either solid or liquid. Solid form preparations include, for example, powders, tablets, dispersible granules, capsules, cachets, and suppositories.

A solid carrier can be one or more substances which can also act as diluents, flavoring agents, solubilizers, lubricants, suspending agents, binders, or tablet disintegrating agents; it can also be an encapsulating material.

In powders, the carrier is generally a finely divided solid which is in a mixture with the finely divided active component. In tablets, the active compound is mixed with the carrier having the necessary binding properties in suitable proportions and compacted in the shape and size desired.

For preparing pharmaceutical composition in the form of suppositories, a low-melting wax such as a mixture of fatty acid glycerides and cocoa butter is first melted and the active ingredient is dispersed

therein by, for example, stirring. The molten homogeneous mixture is then poured into convenient-sized molds and allowed to cool and solidify.

Powders and tablets preferably contain between  
5 about 5% to about 70% by weight of the active ingredient. Suitable carriers include, for example, magnesium carbonate, magnesium stearate, talc, lactose, sugar, pectin, dextrin, starch, tragacanth, methyl cellulose, sodium carboxymethyl cellulose, a low-melting wax, cocoa  
10 butter and the like.

The pharmaceutical compositions can include the formulation of the active compound with encapsulating material as a carrier providing a capsule in which the active component (with or without other carriers) is  
15 surrounded by a carrier, which is thus in association with it. In a similar manner, cachets are also included. Tablets, powders, cachets, and capsules can be used as solid dosage forms suitable for oral administration.

Liquid pharmaceutical compositions include, for  
20 example, solutions suitable for oral or parenteral administration, or suspensions, and emulsions suitable for oral administration. Sterile water solutions of the active component or sterile solutions of the active component in solvents comprising water, ethanol, or  
25 propylene glycol are examples of liquid compositions suitable for parenteral administration.

Sterile solutions can be prepared by dissolving the active component in the desired solvent system, and then passing the resulting solution through a membrane  
30 filter to sterilize it or, alternatively, by dissolving the sterile compound in a previously sterilized solvent under sterile conditions.

Aqueous solutions for oral administration can be prepared by dissolving the active compound in water and adding suitable flavorants, coloring agents, stabilizers, and thickening agents as desired. Aqueous  
5 suspensions for oral use can be made by dispersing the finely divided active component in water together with a viscous material such as natural or synthetic gums, resins, methyl cellulose, sodium carboxymethyl cellulose, and other suspending agents known to the pharmaceutical  
10 formulation art.

Preferably, the pharmaceutical composition is in unit dosage form. In such form, the composition is divided into unit doses containing appropriate quantities of the active Oxadiazole. The unit dosage form can be a  
15 packaged preparation, the package containing discrete quantities of the preparation, for example, packeted tablets, capsules, and powders in vials or ampules. The unit dosage form can also be a capsule, cachet, or tablet itself, or it can be the appropriate number of any of  
20 these packaged forms.

As pharmaceutical compositions for treating infections, pain, or any other indication the compounds of the present invention are generally in a pharmaceutical composition so as to be administered to a  
25 subject at dosage levels of from 0.7 to 7000 mg per day, and preferably 1 to 500 mg per day, for a normal human adult of approximately 70 kg of body weight, this translates into a dosage of from 0.01 to 100 mg/kg of body weight per day. The specific dosages employed,  
30 however, can be varied depending upon the requirements of the patient, the severity of the condition being treated, and the activity of the compound being employed. The determination of optimum dosages for a particular situation is within the skill of the art.

The compounds of Formula (I) and combinatorial libraries containing the same can be prepared as set forth in the Reaction Schemes provided in the Reaction Schemes 2 through 5 and described below.

- 5                Several variant oxadiazole combinatorial libraries have been prepared in order to achieve a high level of diversity. Different types of nitrile containing substrates were attached to solid support. Among the available nitriles, those containing a
- 10 carboxylic acid moiety were coupled to a resin-bound amine via an amide bond (Scheme 1: Attachment of Cyanocarboxylic acids to solid support). The carboxylic acid was coupled directly to a resin bound primary amine such as methyl benzhydrylamine (MBHA), or RINK amide
- 15 linker or other resins known in the art which afford a primary amide functional group after cleavage. Alternatively the cyano carboxylic acids were coupled to resin-bound primary or secondary amines which become incorporated into the product as secondary or tertiary
- 20 amides after cleavage from the resin. These could be prepared by reductive amination of a primary amine to an aldehyde resin or vice-versa, or to any other resin-bound primary or secondary amine prepared by methods known to those skilled in the art.
- 25                Cyanophenols were coupled to solid support via an ether linkage as shown in Scheme 2: Attachment of cyanophenols to solid support which releases the free phenol after cleavage, by alkylation of a benzyl halide resin such as Merrifield resin or alkoxybenzyl bromide
- 30 resin (Wang bromide resin). Alternatively, the cyanophenols were coupled to an alkyl halide moiety which remains covalently attached to the oxadiazole product after cleavage from the resin. For example, a primary or secondary amine bound to the resin through a cleavable
- 35 linker is acylated with chloroacetic anhydride or 3- or

4-chloromethyl benzoic acid. A cyanophenol was then introduced by nucleophilic displacement of the alkyl halide. In this way, a wide range of cyanophenyl compounds was made, and converted to oxadiazole compounds by the methods described below.

Other types of nitrile containing compounds can be similarly linked to common resins as shown in Scheme 3: Linking nitriles to solid support. For example, 3-cyanophenyl isocyanate and 4-cyanophenyl isocyanate were linked to the resin by forming a urea linkage and the nitrile function elaborated into an oxadiazole. Additionally, cyanohydrins may be formed on the resin by the action of Trimethylsilyl cyanide on resin-bound aldehydes and ketones. Alkyl nitriles may be formed by displacement of leaving groups with cyanide anion. Primary and secondary amines attached to the resin were alkylated with 3- and 4-cyanobenzylbromide, and the cyanobenzylamines converted to oxadiazoles. Because of the relatively low number of suitable commercially available nitriles, N-Boc 2-cyanoethyl glycine was also found to be a useful precursor to a large number of oxadiazole derivatives. The cyanoethyl group was first converted to the oxadiazole followed by conversion of the Boc-protected amine to a variety of derivatives.

In order to provide further diversity, conversion of the nitrile function into the oxadiazole ring was done following a number of methods (Scheme 4: Conversion of Nitriles into Oxadiazoles). Treatment of the nitriles with hydroxylamine in alcohol solvent provided the amidoximes in quantitative yield. The amidoximes were then treated with different types of acylating agents to give 3,5-substituted oxadiazoles. In a first embodiment, the amidoximes were treated with trichloroacetic anhydride to give the 5-trichloromethyl derivatives which were further reacted with secondary

amines to give 5-amino oxadiazoles by displacement of the trichloromethyl group. Alternatively, the amidoximes were treated with chloroacetic anhydride to give the 5-chloromethyl oxadiazoles. This primary chloride could be  
5 displaced with diverse primary or secondary amines to give substituted 2% or 3% amines. These could be derivatized further to introduce an additional variable substituent. This strategy was particularly useful for the preparation of compounds attached to the resin by TFA  
10 labile bonds which preclude the use of N-Boc-protected amino acids (vide infra). This was also the method of choice with cyanoethyl glycine derivatives. Third, the amidoximes were converted to oxadiazoles by reaction with BOC amino acid anhydrides or Fmoc amino acid anhydrides  
15 to give the substituted oxadiazole derivatives. Natural L-amino acid derivatives (e.g. Gly, Phe, Leu) were used as well as D- or L-amino acids, cyclic amino acids (e.g. Pro, Nipecotic acid, Isonipecotic acid, tetrahydroisoquinoline carboxylic acid), unnatural amino  
20 acids, or other aliphatic carboxylic acids and anhydrides. In all cases, the carboxylic acid moiety becomes incorporated into the oxadiazole ring.

Furthermore, the N-BOC or N-Fmoc protecting group could be removed under standard conditions and the  
25 resulting amine derivatized with an additional diverse set of reagents (Scheme 5: Derivatization of Oxadiazoles). For example amide, sulfonamide, urea and thiourea derivatives were obtained by reaction with acid anhydride, sulfonyl chloride, isocyanates and  
30 isothiocyanates respectively. Fourth, the amidoximes can be reacted with activated carboxylic acid derivatives other than anhydrides. Any acylating reagent known in the art could be used in the synthesis of oxadiazoles, including but not limited to acid chlorides, and  
35 fluorides, mixed anhydrides, active esters such as

pentafluorophenyl, 4-nitrophenyl, hydroxybenzotriazole, N-hydroxysuccinimide and the like.

In general, large diverse combinatorial libraries of oxadiazole compounds were prepared by assembling the three sets of building blocks in all possible permutations. Thus the libraries are described as having three variable positions, or three diversity sites. In one embodiment of these methods, the first diversity site is defined by the nitrile containing moiety, or its precursor, attached to the resin. This includes, but is not limited to, cyanocarboxylic acids, cyanobenzyl halides and cyanophenols, and the coupling of these through appropriate chemistry to diverse compounds on solid support. Additionally, these methods are meant to include as starting materials other products synthesized on solid phase whereby an aliphatic, aromatic or heteroaromatic nitrile compound is obtained. The second diversity site is introduced in the oxadiazole formation and is defined by the appropriately functionalized carboxylic acid anhydride used in the cyclization step. The third diversity site is created by the derivatization of a reactive site introduced by the carboxylic acid moiety in the previous step. More specifically, the use of protected amino acid derivatives is particularly useful in the present invention. The amino acid side chain provides the second diversity site as defined above. Derivatization of the amino group with carboxylic acids, sulfonyl chlorides, isocyanates, isothiocyanates, alkyl halides or aldehydes provides the third diversity site. Other reactive functional groups incorporated in protected or unprotected form can also serve to introduce the third diversity element. In another embodiment of the invention, bifunctional carboxylic acid derivatives are used to form the oxadiazole ring and an attachment point for a third diversity site. This attachment point can be a

nucleophilic site (e.g. alcohol, thiol, carbon nucleophile, etc.) or an electrophilic site (halide, tosylate, triflate, activated carboxylate, etc). In particular, cyclic anhydrides such as succinic anhydride, diglycolic anhydride, 1,2-cyclopropane dicarboxylic anhydride are preferred embodiments. The oxadiazole cyclization produces a pendant carboxylic acid which can be further activated with standard coupling reagents and coupled to diverse amines. Another preferred embodiment of the invention is the use of chloroacetic anhydride or other halocarboxylic acid anhydrides in the oxadiazole cyclization creating a chloromethyl group which is readily displaced with diverse nucleophiles such as amines, thiols, alcohols, phenols or carbon nucleophiles. In a most preferred embodiment primary amines or secondary diamines are used which are derivatized further with carboxylic acids, sulfonyl chlorides, isocyanates, isothiocyanates or alkyl halides.

The synthesis of oxadiazoles on solid support could also be performed in the opposite orientation. A carboxylic acid moiety could be attached to the solid support in a variety of different ways, for example, an amino acid ester is attached to a resin by reductive amination, or by reaction with a chloroformate resin derivative, followed by hydrolysis of the ester. Alternatively, a resin bound amine can be reacted with a cyclic anhydride such as succinic anhydride. Other methods of providing a free carboxylic acid on solid support are known in the art. The carboxylic acid is then converted to an activated derivative such as the mixed anhydride with isobutyl chloroformate, or an active ester with pentafluorophenol, 4-nitrophenol, N-hydroxysuccinimide, HOBT or other activated derivatives such as those used routinely in the formation of amide or ester bonds. This activated resin bound carboxylate is then treated immediately with a solution of amidoxime,

prepared by the reaction of a nitrile compound with hydroxylamine under standard conditions.

The nonsupport-bound combinatorial libraries can be screened as mixtures in solution in assays such as  
5 radio-receptor inhibition assays, anti-bacterial assays, anti-fungal assays, calmodulin-dependent phosphodiesterase (CaMPDE) assays and phosphodiesterase (PDE) assays, as described in detail below. Deconvolution of highly active mixtures can then be  
10 carried out by iterative or positional scanning methods. These techniques, the iterative approach or the positional scanning approach, can be utilized for finding other active compounds within the combinatorial libraries of the present invention using any one of the below-  
15 described assays or others well known in the art.

The iterative approach is well-known and is set forth in general in Houghten et al., *Nature*, 354, 84-86 (1991) and Dooley et al., *Science*, 266, 2019-2022 (1994), both of which are incorporated herein by reference. In  
20 the iterative approach, for example, sub-libraries of a molecule having three variable groups are made wherein the first variable is defined. Each of the compounds with the defined variable group is reacted with all of the other possibilities at the other two variable groups.  
25 These sub-libraries are each tested to define the identity of the second variable in the sub-library having the highest activity in the screen of choice. A new sub-library with the first two variable positions defined is reacted again with all the other possibilities at the  
30 remaining undefined variable position. As before, the identity of the third variable position in the sub-library having the highest activity is determined. If more variables exist, this process is repeated for all variables, yielding the compound with each variable  
35 contributing to the highest desired activity in the

screening process. Promising compounds from this process can then be synthesized on larger scale in traditional single-compound synthetic methods for further biological investigation.

5

The positional-scanning approach has been described for various combinatorial libraries as described, for example, in R. Houghten *et al.*

PCT/US91/08694 and U.S. Patent 5,556,762, both of which  
10 are incorporated herein by reference. In the positional scanning approach, sublibraries are made defining only one variable with each set of sublibraries and all possible sublibraries with each single variable defined (and all other possibilities at all of the other variable  
15 positions), made and tested. From the instant description one skilled in the art could synthesize combinatorial libraries wherein two fixed positions are defined at a time. From the testing of each single-variable defined combinatorial library, the optimum  
20 substituent at that position can be determined, pointing to the optimum or at least a series of compounds having a maximum of the desired biological activity. Thus, the number of sublibraries for compounds with a single position defined will be the number of different  
25 substituents desired at that position, and the number of all the compounds in each sublibrary will be the product of the number of substituents at each of the other variables.

Individual compounds and pharmaceutical  
30 compositions containing the compounds, as well as methods of using the same, are included within the scope of the present invention. The compounds of the present invention can be used for a variety of purposes and indications and as medicaments for any such purposes and  
35 indications. For example, as described above, compounds of the present invention, including oxadiazole

derivatives, can be used as pesticides, acaricides, receptor agonists and antiviral agents. Additionally, the subject compounds can be useful as analgesics. Assays which can be used to test the biological activity of the instant compounds include antimicrobial assays, a competitive enzyme-linked immunoabsorbent assay and radio-receptor assays, as described below.

The ability of the compounds to inhibit bacterial growth, and therefore be useful to that infection, can be determined by methods well known in the art. Compounds of the present invention were shown to have antimicrobial activity by the *in vitro* antimicrobial activity assay described in Example 36 below and, therefore, are useful as antimicrobial agents.

In addition, an exemplary *in vitro* antimicrobial activity assay is described in Blondelle and Houghten, *Biochemistry* 30:4671-4678 (1991), which is incorporated herein by reference. In brief, *Staphylococcus aureus* ATCC 29213 (Rockville, MD) is grown overnight at 37°C in Mueller-Hinton broth, then re-inoculated and incubated at 37°C to reach the exponential phase of bacterial growth (i.e., a final bacterial suspension containing  $10^5$  to  $5 \times 10^5$  colony-forming units/ml). The concentration of cells is established by plating 100  $\mu$ l of the culture solution using serial dilutions (e.g.,  $10^{-2}$ ,  $10^{-3}$  and  $10^{-4}$ ) onto solid agar plates. In 96-well tissue culture plates, compounds, individual or in mixtures, are added to the bacterial suspension at concentrations derived from serial two-fold dilutions ranging from 1500 to 2.9  $\mu$ g/ml. The plates are incubated overnight at 37°C and the growth determined at each concentration by OD<sub>620</sub> nm. The IC<sub>50</sub> (the concentration necessary to inhibit 50% of the growth of the bacteria) can then be calculated.

The competitive ELISA method which can be used here is a modification of the direct ELISA technique described previously in Appel et al., J. Immunol. 144:976-983 (1990), which is incorporated herein by  
5 reference. It differs only in the MAb addition step. Briefly, multi-well microplates are coated with the antigenic peptide (Ac-GASYPNLSNQQT-NH<sub>2</sub>) at a concentration of 100 pmol/50  $\mu$ l. After blocking, 25  $\mu$ l of a 1.0 mg/ml solution of each mixture of a synthetic  
10 combinatorial library (or individual compound) is added, followed by MAb 125-10F3 (Appel et al., *supra*) (25  $\mu$ l per well). The MAb is added at a fixed dilution in which the bicyclic guanidine in solution effectively competes for MAb binding with the antigenic peptide adsorbed to the  
15 plate. The remaining steps are the same as for direct ELISA. The concentration of compound necessary to inhibit 50% of the MAb binding to the control peptide on the plate (IC<sub>50</sub>) is determined by serial dilutions of the compound.

20 Alternative screening can be done with radio-receptor assays. The radio-receptor assay, can be selective for any one of the  $\mu$ ,  $\kappa$ , or  $\delta$  opiate receptors. Compounds of the present invention can be useful in vitro for the diagnosis of relevant opioid receptor subtypes,  
25 such as  $\kappa$ , in the brain and other tissue samples. Similarly, the compounds can be used *in vivo* diagnostically to localize opioid receptor subtypes.

The radio-receptor assays are also an indication of the compounds' analgesic properties as  
30 described, for example, in Dooley et al., *Proc. Natl. Acad. Sci.*, 90:10811-10815 (1993). For example, it can be envisioned that these compounds can be used for therapeutic purposes to block the peripheral effects of a centrally acting pain killer. For instance, morphine is

a centrally acting pain killer. Morphine, however, has a number of deleterious effects in the periphery which are not required for the desired analgesic effects, such as constipation and pruritus (itching). While it is known  
5 that the many compounds do not readily cross the blood-brain barrier and, therefore, elicit no central effect, the subject compounds can have value in blocking the periphery effects of morphine, such as constipation and pruritus. Accordingly, the subject compounds can also be  
10 useful as drugs, namely as analgesics, or to treat pathologies associated with other compounds which interact with the opioid receptor system.

Additionally, such compounds can be tested in a  $\sigma$  receptor assay. Ligands for the  $\sigma$  receptor can be  
15 useful as antipsychotic agents, as described in Abou-Gharbia et al., *Annual Reports in Medicinal Chemistry*, 28:1-10 (1993).

Radio-receptor assays can be performed with particulate membranes prepared using a modification of  
20 the method described in Pasternak et al., *Mol. Pharmacol.* 11:340-351 (1975), which is incorporated herein by reference. Rat brains frozen in liquid nitrogen can be obtained from Rockland (Gilbertsville, PA). The brains are thawed, the cerebella removed and the remaining  
25 tissue weighed. Each brain is individually homogenized in 40 ml Tris-HCl buffer (50 mM, pH 7.4, 4°C) and centrifuged (Sorvall® RC5C SA-600: Du Pont, Wilmington, DE) (16,000 rpm) for 10 minutes. The pellets are resuspended in fresh Tris-HCl buffer and incubated at  
30 37°C for 40 minutes. Following incubation, the suspensions are centrifuged as before, the resulting pellets resuspended in 100 volumes of Tris buffer and the suspensions combined. Membrane suspensions are prepared and used in the same day. Protein content of the crude  
35 homogenates generally range from 0.15-0.2 mg/ml as

determined using the method described in Bradford, M.M., *Anal. Biochem.* 72:248-254 (1976), which is incorporated herein by reference.

Binding assays are carried out in polypropylene  
5 tubes, each tube containing 0.5 ml of membrane  
suspension. 8 nM of  $^3\text{H}$ -[D-Ala<sup>2</sup>,Me-Phe<sup>4</sup>,Gly-ol<sup>5</sup>]enkephalin  
(DAMGO) (specific activity = 36 Ci/mmol, 160,000 cpm per  
tube; which can be obtained from Multiple Peptide  
Systems, San Diego, CA, through NIDA drug distribution  
10 program 271-90-7302) and 80  $\mu\text{g/ml}$  of bicyclic guanidine,  
individual or as a mixture and Tris-HCl buffer in a total  
volume of 0.65 ml. Assay tubes are incubated for 60  
mins. at 25°C. The reaction is terminated by filtration  
through GF-B filters on a Tomtec harvester (Orange, CT).  
15 The filters are subsequently washed with 6 ml of Tris-HCl  
buffer, 4°C. Bound radioactivity is counted on a  
Pharmacia Biotech Betaplate Liquid Scintillation Counter  
(Piscataway, NJ) and expressed in cpm. To determine  
inter- and intra-assay variation, standard curves in  
20 which  $^3\text{H}$ -DAMGO is incubated in the presence of a range of  
concentrations of unlabeled DAMGO (0.13-3900 nM) are  
generally included in each plate of each assay (a 96-well  
format). Competitive inhibition assays are performed as  
above using serial dilutions of the bicyclic guanidines,  
25 individually or in mixtures.  $\text{IC}_{50}$  values (the  
concentration necessary to inhibit 50% of  $^3\text{H}$ -DAMGO  
binding) are then calculated.  $\text{IC}_{50}$  values of less than  
1000 nM are indicative of highly active opioid compounds  
which bind to the  $\mu$  receptor, with particularly active  
30 compounds having  $\text{IC}_{50}$  values of 100 nM or less and the  
most active compounds with values of less than 10 nM.

As opposed to this  $\mu$  receptor selective assay,  
which can be carried out using  $^3\text{H}$ -DAMGO as radioligand, as  
described above, assays selective for  $\kappa$  receptors can be  
35 carried out using [ $^3\text{H}$ ]-U69,593 (3 nM, specific activity 62

Ci/mmol) as radioligand. Assays selective for  $\delta$  opiate receptors can be carried out using tritiated DSLET ([D-Ser<sup>2</sup>, D-Leu<sup>5</sup>]-threonine-enkephalin) as radioligand. Assays selective for the  $\sigma$  opiate receptor can use  
5 radiolabeled pentazocine as ligand.

Screening of combinatorial libraries and compounds of the invention can be done with an anti-fungal assay. Compounds of the present invention can be useful for treating fungal infections.

10 Screening of combinatorial libraries and compounds of the invention also can be done with a calmodulin-dependent phosphodiesterase (CaMPDE) assay. Compounds of the present invention can be useful as calmodulin antagonists.

15 Calmodulin (CaM), which is the major intracellular calcium receptor, is involved in many processes that are crucial to cellular viability. In particular, calmodulin is implicated in calcium-stimulated cell proliferation. Calmodulin antagonists  
20 are, therefore, useful for treating conditions associated with increased cell proliferation, for example, cancer. In addition, calmodulin antagonists such as compounds of the subject invention are useful both in vitro and in vivo for identifying the role of calmodulin in other  
25 biological processes. The disadvantages of known antagonists such as trifluoperazine and N-(4-aminobutyl)-5-chloro-2-naphthalenesulfonamide (W13) include their non-specificity and toxicity. In contrast, advantages of the combinatorial libraries and compounds of the subject  
30 invention as calmodulin antagonists include their reduced flexibility and ability to generate broader conformational space of interactive residues as compared to their linear counterparts.

An example of an assay that identifies CaM antagonists is a CaMPDE assay. In brief, samples are mixed with 50  $\mu$ l of assay buffer (360 mM Tris, 360 mM Imidazole, 45 mM  $\text{Mg}(\text{CH}_3\text{COO})_2$ , pH 7.5) and 10  $\mu$ l of  $\text{CaCl}_2$  (4.5 mM) to a final volume of 251  $\mu$ l. 25  $\mu$ l of calmodulin stock solution (Boehringer Mannheim; 0.01  $\mu\text{g}/\mu\text{l}$ ) is then added and the samples then sit at room temperature for 10 minutes. 14  $\mu$ l of PDE (Sigma; 2 Units dissolved in 4 ml of water; stock concentration: 0.0005 Units/ $\mu$ l) is then added, followed by 50  $\mu$ l of 5'-nucleotidase (Sigma; 100 Units dissolved in 10 ml of 10 mM Tris-HCl containing 0.5 mM  $\text{Mg}(\text{CH}_3\text{COO})_2$ , pH 7.0; stock concentration: 10 Units/ml). The samples are then incubated for 10 minutes at 30°C. 50  $\mu$ l of adenosine 3',5'-cyclic monophosphate (cAMP) (20 mM in water at pH 7.0) is added, the samples incubated for 1 hour at 30°C and then vortexed. 200  $\mu$ l of trichloroacetic acid (TCA) (55% in water) is added to a 200  $\mu$ l sample aliquot, which is then vortexed and centrifuged for 10 minutes. 80  $\mu$ l of the resulting supernatants of each sample is transferred to a 96-well plate, with 2 wells each containing 80  $\mu$ l of each sample. 80  $\mu$ l of ammonium molybdate (1.1% in 1.1N  $\text{H}_2\text{SO}_4$ ) is then added to all the wells, and the OD of each were determined at 730nm, with the values later subtracted to the final OD reading. 16  $\mu$ l of reducing agent (6g sodium bisulfite, 0.6g sodium sulfite and 125mg of 1-amino-2-naphtol-4-sulfonic acid in 50ml of water) is then added to one of each sample duplicate and 16  $\mu$ l of water is added to the other duplicate. After sitting for 1 hour at room temperature, the OD of each well is determined at 730nm. The percent inhibition of calmodulin activity is then calculated for each sample, using as 0% inhibition a control sample containing all reagents without any test samples and as 100% inhibition a control sample containing test samples and all reagents except calmodulin. In addition, the percent inhibition of phosphodiesterase activity was

determined by following a similar protocol as the CaMPDE assay described above, except not adding calmodulin to the sample mixture and calculating the percent inhibition by using as 0% inhibition a control reagent without any test samples and as 100% inhibition a control sample containing test samples and all reagents except cAMP.

## EXAMPLE 14

## Synthesis of Oxadiazoles from Amidoximes

## General Procedure

A resin bound amidoxime of Example 12 was  
5 swollen in 2-methoxyethyl ether. A solution of the  
appropriate carboxylic acid anhydride (7 eq) in 2-  
methoxyethyl ether (0.2M) was added to the amidoxime.  
When the anhydride was not commercially available it was  
prepared from a solution of carboxylic acid (14 eq, 0.4M)  
10 in 2-methoxyethyl ether to which was added DIC (7 eq,  
0.2M) and shaken for 30 minutes before addition of the  
resin bags. The solution of anhydride and the resin  
bound amidoxime were heated to 60-C for 16 hours. The  
solution was cooled and the resin washed twice with fresh  
15 2-methoxyethyl ether. Sufficient 2-methoxyethyl ether  
was added to cover the resin and the solution heated to  
85-C for 6 hours. The solvent was removed and the resin  
washed with DMF, DCM, MeOH and dried to give the  
anticipated oxadiazole bound resin.

Oxadiazoles from Amidoximes and BOC-Amino  
Acid Anhydrides TRG3600

To each of 36 tubes was added Boc-protected  
amino acid derivatives according to Table 2: Distribution  
25 of Amino Acids. Each amino acid (28 mmol) was dissolved  
in 55 ml of 2-methoxyethyl ether. To each tube was then  
added DIC (14 mmol) and the solution stirred at RT for 1  
hr at which time a white precipitate had formed. The  
appropriate bags containing amidoxime from the previous  
30 step were then added and the reaction tubes were placed  
in a heating block at 60-C for 16 hr. The supernatant was  
removed and the resins washed twice with fresh 2-  
methoxyethyl ether. The bags were placed in 50 ml 2-

100

methoxyethyl ether and heated to 85-C for 6 hr. The tubes were cooled, and the bags washed 3X DMF, 3X DCM, 3X MeOH and dried to give 5-(N-Boc-amino)substituted oxadiazoles bound to resin.

## EXAMPLE 16

Oxadiazoles from Amidoximes and  
FMOC-Amino Acid Anhydrides

The resin bound amidoximes from Example 12 were swollen in 2-methoxyethyl ether (0.1 mmol). The appropriate FMOC amino acids, Table 3: FMOC-amino acids, (3 mmol) were dissolved in 8 ml of 2-methoxyethyl ether. To each tube was then added DIC (1.5 mmol) and the solution stirred at RT for 1 hr at which time a white precipitate had formed. The appropriate bags containing amidoxime were then added and the reaction tubes were placed in a heating block at 60-C for 16 hr. The supernatant was removed and the resins washed twice with fresh 2-methoxyethyl ether. The bags were placed in 10 ml 2-methoxyethyl ether and heated to 85-C for 6 hr. The tubes were cooled, and the bags washed 3X DMF, 3X DCM, 3X MeOH and dried to give 5-((N-FMOC-amino)substituted oxadiazoles bound to resin.

## EXAMPLE 17

## 5-Chloromethyl Oxadiazoles from Amidoximes

To a solution of chloroacetic anhydride (0.2M) in 2-Methoxyethyl ether (8 eq.) was added teabags containing Amidoximes from Example 12. The reaction  
15 tubes were placed in a heating block at 60-C for 16 hrs, the supernatant removed and the resins washed twice with fresh 2-methoxyethyl ether. The bags were covered in 2-methoxyethyl ether and heated to 85-C for 6 hr. The tubes were cooled, and the bags washed 3X times each with  
20 DMF, DCM, MeOH and dried to give 5-chloromethyl oxadiazoles bound to resin.

## EXAMPLE 18

## 5-Aminomethyl oxadiazoles from 5-Chloromethyl Oxadiazoles

The resins from Example 17 were placed in a  
25 solution of amine according to Table 3: Primary and secondary amines (0.2 M, 10 eq) in anhydrous DMF and shaken at RT for 2 hrs. The bags were then washed with DMF 4X, DCM 2X and MeOH to give 5-substituted aminomethyl oxadiazoles bound to resin.

## EXAMPLE 19

## Acylation of Oxadiazole Amines - General procedure

The Boc-protected Oxadiazole resins of Example 15 were treated with two portions of 50% TFA/DCM (5 min. then 30 min.), washed 3 times each with DCM, MeOH, MTBE and dried. The FMOC-protected Oxadiazole resins of Example 16 were treated with two portions of 20% piperidine in DMF, then washed with DMF, MeOH, MTBE and dried. The aminomethyl oxadiazoles of Example 18 were used without further precautions. The resins were suspended in DMF and distributed into a 96 well microtiter plate. The supernatant solvent was removed and the following solutions were added: a carboxylic acid solution, a solution of DMAP, HOBT and DIEA, a solution of DIC in DMF or DCM. Other coupling agents such as BOP, PyBOP, HATU, HBTU and others known in the art were also used in separate experiments. The quantities of each solution were adjusted according to the amount of resin per well in the plate, in order to have a five to tenfold excess of reagents. The 96 well plates were capped and shaken overnight at RT. The resins were then washed with DMF (8X), MeOH (4X) and the resin allowed to dry resulting in the N-acylated-5-(substituted aminomethyl)oxadiazoles bound to resin.

## EXAMPLE 20

## Sulfonylation of Oxadiazole Amines

The Boc-protected oxadiazole resins of Example 15 were treated with two portions of 50% TFA/DCM (5 min. then 30 min.), washed 3 times each with DCM, MeOH, MTBE and dried. The FMOC-protected oxadiazole resins of Example 16 were treated with two portions of 20% piperidine in DMF, then washed with DMF, MeOH, MTBE and dried. The aminomethyl oxadiazoles of Example 18 were used without further precautions. The resins were suspended in DMF and distributed into a 96 well microtiter plate. The supernatant solvent was removed, and the resin washed with acetonitrile. A solution of N-methylimidazole (5.5 to 11 eq/mmol resin) in acetonitrile

was added followed by a solution of sulfonyl chloride in ACN ( 5 to 10 eq/mmol resin). The plates were capped and vortexed and shaken overnight. The plates were then washed with ACN (8X) and MeOH (8X), and dried to give substituted 5-(N-sulfonyl)-oxadiazoles bound to resin.

## EXAMPLE 21

## Synthesis of Oxadiazole Ureas

The Boc-protected oxadiazole resins of Example 15 were treated with two portions of 50% TFA/DCM (5 min. then 30 min.), washed 3 times each with DCM, MeOH, MTBE and dried. The Fmoc-protected oxadiazole resins of Example 16 were treated with two portions of 20% piperidine in DMF, then washed with DMF, MeOH, MTBE and dried. The aminomethyl oxadiazoles of Example 18 were 20 used without further precautions. The resins were suspended in DMF and distributed into a 96 well microtiter plate. The resin was then washed and neutralized with 5% DIEA in 1,2-dichloroethane(DCE) /THF (2:1) and washed with DCE/THF (2:1) to remove excess 25 base. The following Isocyanates were dissolved to a concentration of 0.2 M in DCE/THF (2:1) and added to the plates. The solutions were shaken at RT overnight and then the plates were washed with DCE/THF (2:1), DMF, MeOH and dried to give N-substituted ureido oxadiazole resins.

EXAMPLE 22  
Synthesis of Oxadiazole Thioureas

5           The Boc-protected Oxadiazole resins of Example  
15 were treated with two portions of 50% TFA/DCM (5 min.  
then 30 min.), washed 3 times each with DCM, MeOH, MTBE  
and dried. The Fmoc-protected Oxadiazole resins of  
10 piperidine in DMF, then washed with DMF, MeOH, MTBE and  
dried. The aminomethyl oxadiazoles of Example 18 were  
used without further precautions. The resins were  
suspended in DMF and distributed into a 96 well  
microtiter plate. The resin was then washed and  
15 neutralized with 5% DIEA in 1,2-dichloroethane (DCE) /THF  
(2:1) and washed with DCE/THF (2:1) to remove excess  
base. The following Isothiocyanates were dissolved to a  
concentration of 0.2 M in DCE/THF (2:1) and added to the  
plates. The solutions were shaken at RT overnight and  
20 then the plates were washed with DCE/THF (2:1), DMF, MeOH  
and dried to give N-substituted thioureido oxadiazole  
resins.

#### Oxadiazoles derived from 2-Cyanoethylglycine (Part 1)

5           Boc 2-cyanoethyl glycine was loaded onto MBHA resin and converted to the Amidoxime as described in the general procedures of Example 13. This amidoxime resin was treated with a BOC amino acid anhydride as described in Example 15. The bis BOC protected oxadiazole  
10 derivative was then treated with 50 % TFA in DCM (2 X 15 min) and washed with DCM and MeOH. The diamines were then treated with 0.2 M benzoic acid, DIC, HOBT and DIEA in DCM or with acetic anhydride in DCM at RT overnight. The resin was washed with DMF 4X, DCM 2X and MeOH and  
15 dried to give the di-acylated oxadiazole resins. Alternatively, the amidoxime is treated with an FMOC amino acid anhydride as in the procedure of Example 16 to give mono-acylated- (FMOC amino)oxadiazole resins.

### EXAMPLE 24

#### 20 Aminomethyl Oxadiazoles derived from 2-Cyanoethylglycine (Part 2)

          Boc 2-cyanoethyl glycine is loaded onto MBHA resin and converted to the oxadiazole as described in Example 17. Individual tea bags containing portions of  
25 the resulting 5-chloromethyl oxadiazole derivative are then treated with diverse amines in DMF as in Example 18. The 5-aminomethyl oxadiazole derivatives are then acylated to give the N-acylated-5-(substituted aminomethyl)oxadiazole resins, sulfonylated to give N-  
30 sulfonyl-5-(substituted aminomethyl)oxadiazole resins, alkylated to give N- alkylated-5-(substituted aminomethyl)oxadiazole resins, treated with isocyanates to give N-substituted ureidooxadiazole resins or

isothiocyanates to give N- substituted  
thioureidooxadiazole resins as described in Example 19,  
Example 20, Example 21, and Example 22. The products are  
then treated with 50% TFA in DCM to remove the remaining  
5 BOC group. The amino group from the groups defined above  
are further converted to either an amide, sulfonamide,  
urea or thiourea derivative following the general  
procedures of Example 19, Example 20, Example 21, and  
Example 22 to give a diverse library of oxadiazole  
10 resins.

#### EXAMPLE 25

##### Cleavage and Extraction of Products Synthesized on MBHA resin

To the dry microtiter plates containing the  
15 oxadiazole resin products was added 25 ul anisole in each  
well. The plates were then exposed to HF gas in an HF  
apparatus at RT for 1 hr. Some HF condensed in each well  
thus nitrogen was blown through the apparatus to remove  
the excess HF. The plates were then transferred to a  
20 polypropylene vacuum dessicator and evacuated overnight.  
The plates were then extracted into tared plates with  
either 1:1 Acetonitrile/water, Acetic acid or DMF. The  
plates containing product were lyophilized and the  
average yield measured. The products were analyzed by  
25 mass spectrometry and HPLC/MS.

## EXAMPLE 26

Cleavage and Extraction of Products Synthesized on Wang or DAB resin

To the dry microtiter plates containing the  
5 oxadiazole resin products was added 1 ml of a solution of  
TFA/DCM (25 TO 50% TFA) in each well. The plates were  
then transferred to a vacuum centrifuge and evacuated  
overnight. The plates were then extracted into tared  
plates with either 1:1 Acetonitrile/water, Acetic acid or  
10 DMF. The plates containing product were lyophilized and  
the yield measured. The products were analyzed by mass  
spectrometry and HPLC/MS.

## EXAMPLE 27

Analysis of the products

15 The products were analyzed by HPLC-MS using a  
Hewlett-Packard HPLC system hooked up to Finnigan-Mat  
LCQ spectrometer. FIA-MS was performed on a Sciex  
instrument, and HPLC was performed on a Waters HPLC  
system equipped with a UV detector and an evaporative  
20 light scattering detector (ELSD).

## EXAMPLE 28

Preparation of carboxylic acids on solid support.

(Part 1)

A resin bound amine of Example 4 and Example 5  
25 (1.0g, 1 mmol) was treated with succinic anhydride (5  
mmol) in 10 ml DCM at RT overnight. The resin teabag was  
washed with DCM and MTBE and dried to give the resin  
bound succinylated amine.

140

## EXAMPLE 29

Preparation of carboxylic acids on solid support.  
(Part 2)

Wang resin (10 g, 12 mmol) was swollen in DCM  
5 for 15 min and the excess solvent poured off. A solution  
of carbonyl diimidazole (10 g, 50 mmol) in DCM was added  
and shaken for 3 hours. The solvent was poured off and  
the resin washed with DCM (2X) then a solution of an  
amino acid ester (50 mmol) and DIEA (50 mmol) in DCM was  
10 added, and the solution shaken overnight. The  
supernatant was removed, and the resin washed with DCM,  
IPA, DMF, IPA and MeOH. The resulting amino acid ester,  
linked to the resin through a carbamate linkage, was then  
treated with a solution of tetramethylammonium hydroxide  
15 (50 mmol) in DCM at RT overnight. The supernatant was  
removed, and the resin washed with DCM, IPA, DMF, IPA and  
MeOH to give the resin-bound carboxylic acid.

## EXAMPLE 30

Synthesis of Amidoximes from nitriles in solution

20 To a solution of benzonitrile (10 mmol) in 100  
ml absolute ethanol was added hydroxylamine hydrochloride  
(12 mmol) and K<sub>2</sub>CO<sub>3</sub> (12 mmol). The solution was heated  
to reflux and monitored by thin layer chromatography for  
the disappearance of nitrile. The solution was then  
25 cooled and filtered and the solvent evaporated to give  
the crude benzamidoxime which was used in the next step  
directly. Other aliphatic, benzylic and aromatic  
nitriles were treated similarly to give the corresponding  
amidoximes.

## EXAMPLE 31

Preparation of oxadiazoles from resin bound  
carboxylic acids

The resin bound carboxylic acids of Example 28  
5 and Example 29, (1 g, 10 mmol) were placed in DCM and  
treated with 10 equivalents each of pentafluorophenol,  
DIEA and diisopropyl carbodiimide. After shaking for 3  
hours, the solvent was poured off and the  
pentafluorophenyl esters were washed with 2-methoxyethyl  
10 ether and treated with a solution of 10 equivalents  
amidoxime from Example 30 in 2-methoxyethyl ether. The  
solution was heated to 60° C overnight. The solvent was  
then removed and the resin washed twice with 2-  
methoxyethyl ether and then heated to 85 °C in fresh with  
15 2-methoxyethyl ether. The solvent was removed and the  
resin washed with MeOH and dried to give oxadiazole  
resins.

## EXAMPLE 32

## Preparation of Oxadiazole combinatorial libraries:

20 Synthesis of TRG 3600

Five carboxylic acid nitriles were coupled to  
15 g of MBHA resin each as described in Example 3. Each  
nitrile resin was then distributed to 36 teabags and sets  
of 5 teabags were converted to oxadiazole derivatives by  
25 conversion to the amidoxime as in Example 13, and each  
amidoxime was reacted with 36 different Boc amino acids  
to give 180 different oxadiazole intermediates as  
described in Example 15. Each of the 180 intermediates  
was deprotected by treatment with 50% TFA/DCM, and each  
30 resin was transferred to a 96 well reaction block. Each  
intermediate in the reaction block was then treated with  
96 carboxylic acids from Example 19. The final products  
were then cleaved from the resin with HF, extracted from  
the resin using acetic acid and lyophilized as described

in Example 25. An aliquot of each product was taken and analyzed by mass spectrometry and HPLC with UV and ELSD detection. This created 17280 oxadiazole amide products which correspond to all permutations of the reagents  
5 listed below.

### EXAMPLE 33

Preparation of Oxadiazole combinatorial libraries:

#### 5 Synthesis of TRG 3900

Five carboxylic acid nitriles were coupled to  
15 g of MBHA resin each as described in Example 3. Each  
nitrile resin was then distributed to 36 teabags and sets  
of 5 teabags were converted to oxadiazole derivatives by  
10 conversion to the amidoxime as in Example 13, and each  
amidoxime was reacted with 36 different Boc amino acids  
to give 180 different oxadiazole intermediates as  
described in Example 15. Each of the 180 intermediates  
was deprotected by treatment with 50% TFA/DCM, and each  
15 resin was transferred to one half of a 96 well reaction  
block. Each of the 180 intermediates was then reacted  
with 48 sulfonyl chlorides following Example 20. The  
final products were then cleaved from the resin with HF,  
extracted from the resin using acetic acid and  
20 lyophilized as described in Example 25. An aliquot of  
each product was taken and analyzed by mass spectrometry  
and HPLC with UV and ELSD detection. This created 8640  
oxadiazole sulfonamide products corresponding to all  
permutations of the reagents listed below.

was deprotected by treatment with 50% TFA/DCM, and each  
resin was transferred to a 96 well reaction block. Each  
intermediate in the reaction block was then treated with  
15 80 carboxylic acids from Example 19, and 16 isocyanates  
from the list below as described in Example 21. The

## EXAMPLE 35

Preparation of Oxadiazole combinatorial libraries:  
Synthesis of TRG 5500

The cyanophenols listed below were coupled to  
5 300 g each of Wang bromide resin to give the  
corresponding cyanophenyl ethers, following the procedure  
of Example 9. 600g of resin bound piperazine prepared in  
Example 5 was converted to 300 g of resin bound 4-  
cyanobenzyl piperazine following Example 8, and 300 g of  
10 resin bound 4-cyanophenoxyacetyl piperazine according to  
the procedures of Example 7 and Example 10. The seven  
resulting resin bound nitriles were converted to the  
amidoxime as described in the general procedure of  
Example 12. The amidoximes were converted to the 5-  
15 chloromethyl oxadiazoles as described in Example 17.  
Each chloromethyl oxadiazole resin was reacted with the  
60 primary amines listed below following the procedure of  
Example 18 to give 420 aminomethyl oxadiazole  
intermediates. Each of the 420 intermediates was reacted  
20 with 80 carboxylic acids to give the amide derivatives  
and 48 sulfonyl chlorides to give sulfonamides according  
to the procedures of Example 19 and Example 20  
respectively. The final products were cleaved from the  
resin with 50% TFA/DCM, and evaporated. The products  
25 were extracted from the resin using acetic acid and  
lyophilized as described in Example 25. An aliquot of  
each product was taken and analyzed by mass spectrometry  
and HPLC with UV and ELSD detection.

## Anti-microbial Screen

Streptococcus pyogenes (ATCC# 97-03 14289) were  
30 grown in Todd Hewitt Broth (THB) (Difco Laboratories  
#0492-17-6) overnight until they reached an optical  
density of (OD = 0.636@ 570 nm) by reading 0.1 ml in a  
96 well microtiter plate in a Molecular Devices  
Thermomax. This preparation was kept frozen as stocks in  
35 30% v/v glycerol in 1.5 ml aliquots at -70 C° until use.

Prior to screening, 1.5 ml aliquots were thawed and diluted into 50 ml THB. 200 ul of this dilution was added to 92 wells of microtiter plate. To three wells THB (200 ul) was added to serve as a blank and a sterility control. Test compounds in DMSO and appropriate concentrations of DMSO were added to Growth/Solvent Controls at 0 time. Plates were read at 0 time at 570 nm in the Molecular Devices plate reader to obtain compounds correction factors for insoluble or colored compounds. Plates were read again at 4 hrs.

Compounds listed in the table below are described in reference to Formula (I), wherein the ring structure is a 1, 2, 4 oxadiazole (where U is an oxygen),  $R_1$  corresponds to the starting material of  $X_1$  and  $X_2$ ,  $R_2$  corresponds to the starting material of  $X_3$  and  $R_3$  corresponds to the starting material of  $X_4$ . The compounds were assayed at a concentration of 170  $\mu\text{g/ml}$ . Percent inhibition for each compound was calculated using the following formulae:

Color correct =  
(O.D. 0 hr - Blank 0 hr) - (Solvent Control 0 hr - Blank 0 hr)

% Inhibition =  
 $100 - \frac{(\text{O.D. test compound 4 hr} - \text{Blank 4 hr} - \text{color correct})}{(\text{O.D. growth/solvent control 4 hr} - \text{Blank 4 hr})}$

## EXAMPLE 37

## Preparation of 1,3,4-Oxadiazoles

The resin bound carboxylic acids of examples 28 and 29 are placed in a solution of 4-nitrophenyl trifluoroacetate (10 equivalents) in DCM and shaken at RT for 6 hours to give the corresponding 4-nitrophenyl esters. The resins are washed 5 times with DCM and a solution of an acyl hydrazide in DMF is added to the 4-nitrophenyl esters. After shaking overnight, the resulting resin bound diacyl hydrazides are washed with DMF, DCM and Methanol (4 times each) and dried. The resin bound diacyl hydrazides are then suspended in a solution of triethylamine (10 eq) and triphenylphosphine (10 eq) in DCM. To the solutions is added carbon tetrachloride (9 eq) dropwise over 15 minutes. The cyclization reaction is allowed to proceed overnight at 45°C. The resins are then washed with DCM and Methanol and dried to provide the resin bound 1,3,4-oxadiazole compounds.

## EXAMPLE 38

## Preparation of 1,3,4-Thiadiazoles

The resin bound carboxylic acids of examples 28 and 29 are placed in a solution of 4-nitrophenyl trifluoroacetate (10 equivalents) in DCM and shaken at RT for 6 hours to give the corresponding 4-nitrophenyl esters. The resins are washed 5 times with DCM and a solution of an acyl hydrazide in DMF is added to the 4-nitrophenyl esters. After shaking overnight, the resulting resin bound diacyl hydrazides are washed with DMF, DCM and Methanol (4 times each) and dried. The diacylhydrazides are suspended in a solution of Lawesson's reagent (10 eq) in toluene, and the solutions heated to 110°C overnight. The resins are then washed

with DCM, DMF, DCM and Methanol (4X each) and dried to provide the resin bound 1,3,4-thiadiazole compounds.

#### EXAMPLE 39

##### Preparation of 1,2,4-Triazoles

5                   The resin bound carboxylic acids of examples 28 and 29 are placed in a solution of 4-nitrophenyl trifluoroacetate (10 equivalents) in DCM and shaken at RT for 6 hours to give the corresponding 4-nitrophenyl esters. The resins are washed 5 times with DCM and a  
10 solution of hydrazide in DMF is added to the 4-nitrophenyl esters. After shaking overnight, the resulting resin bound acyl hydrazides are washed with DMF, DCM and Methanol (4 times each) and dried. The resins are treated with a solution of an amidine (5 eq)  
15 and potassium carbonate (10 eq) in 2-methoxyethanol. The mixtures are heated at 100°C for 3 days, then the resins are washed with DMF and Methanol and dried to provide the corresponding resin bound 1,2,4-triazole compounds.

                  Although the invention has been described with  
20 reference to the examples provided above, it should be understood that various modifications can be made by those skilled in the art without departing from the invention. Accordingly, the invention is set out in the following claims.
